

The patch is generally about updating the permissions on the Com-E "ntp" subdirectory. The following is one live approach to the patch:

- On the Host PC desktop open a bash command console.
- [Host PC] \$ ssh root@come
- [Com-E] # cd /var/lib
- Confirm your current path is /var/lib (just to be sure):
[Com-E] # pwd
- [Com-E] # chown -R ntp ntp
- [Com-E] # chgrp -R ntp ntp
- [Com-E] # exit
- [Host PC] \$ exit

That should be enough.

NTP synchronization between the Com-E and the Host PC can be hours to take effect.

Optionally to confirm:

- In a bash command shell:
[Host PC] \$ ssh come date; date
- The first date stamp is the one from the Com-E. The second is from the Host PC. Are they equal yet?
